

Capitolo 3 – Sviluppo di Programmi Strutturati

1

Outline

Introduzione
Strutture di controllo
If Selection Statement
If...Else Selection Statement
While Repetition Statement
Ripetizione Counter-Controlled
Uso di una sentinella
Strutture di controllo innestate
Operatori di assegnamento
Operatori di Incremento e Decremento

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Introduzione

- Prima di scrivere un programma:
 - Comprendere a fondo il problema
 - Pianificare con cura un approccio per risolverlo
- Mentre si scrive un programma:
 - Individuare quali “building blocks” sono disponibili
 - Usare **buoni principi di programmazione**

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Strutture di controllo

- Teorema di Bohm e Jacopini
 - Tutti i programmi possono essere scritti usando tre strutture di controllo fondamentali
 - SEQUENZA: Nativa nel C. I programmi vengono eseguiti sequenzialmente per default
 - SELEZIONE: Il C ne ha tre tipi: `if`, `if...else`, `switch`
 - ITERAZIONE: Il C ne ha tre tipi: `while`, `do...while` e `for`

3

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

2

***if* Selection Statement**

- Struttura di SELEZIONE:
 - Usata per scegliere tra diverse alternative
 - Pseudocodice:
*If student's grade is greater than or equal to 60
Print "Passed"*
- Se la condizione è vera (`true`)
 - Statement `Print` eseguito e il programma va al prossimo statement
 - Se falsa (`false`), `print` statement ignorato e il programma va al prossimo statement
 - L'indentazione rende il programma più leggibile
 - Il C ignora gli spazi bianchi

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

4

i f Selection Statement

- Statement in C:

```
if ( grade >= 60 )
    printf( "Passed\n" );
```

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

i f...el se Selection Statement

- i f

- Esegue un’azione solo se la condizione è vera (true)

- i f...el se

- Specifica l’azione da eseguire quando la condizione è vera (true) e quando è falsa (false)

- Pseudocodice:

```
If student's grade is greater than or equal to 60
    Print "Passed"
else
    Print "Failed"
```

- Nota la spaziatura e l’indentazione

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

i f...el se Selection Statement

- Codice C:

```
if ( grade >= 60 )
    printf( "Passed\n" );
else
    printf( "Failed\n" );
```

- Operatore condizionale ternario (?:)

- Ha tre argomenti (condizione, valore se true, valore se false)

- Possiamo scrivere:

```
printf( "%s\n", grade >= 60 ? "Passed" : "Failed" );
```

- Oppure:

```
grade >= 60 ? printf( "Passed\n" ) : printf(
    "Failed\n" );
```

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

i f...el se Selection Statement

- i f...el se statement innestati

- Test per casi multipli tramite i f...el se selection statements all’interno di i f...el se selection statement

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

i f...el se Selection Statement

- Pseudocodice per i f...el se innestati

```
If student's grade is greater than or equal to 90
    Print "A"
else
    If student's grade is greater than or equal to 80
        Print "B"
    else
        If student's grade is greater than or equal to 70
            Print "C"
        else
            If student's grade is greater than or equal to 60
                Print "D"
            else
                Print "F"
```

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

i f...el se Selection Statement

- Statement composti:

- Insieme di statements all'interno di coppie di parentesi graffe
- Esempio:

```
if ( grade >= 60 )
    printf( "Passed. \n" );
else {
    printf( "Failed. \n" );
    printf( "You must take this course again. \n" );
}
```

- Senza le parentesi, lo statement

```
printf( "You must take this course again. \n" );
sarebbe eseguito automaticamente
```

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

whi l e Repetition Statement

- Struttura iterativa

- Il programmatore specifica un'azione che deve essere eseguita fino a quando una condizione rimane vera (true)

- Pseudocodice:

```
While there are more items on my shopping list
    Purchase next item and cross it off my list
```

- Ciclo whi l e ripetuto fino a quando la condizione diviene falsa (false)

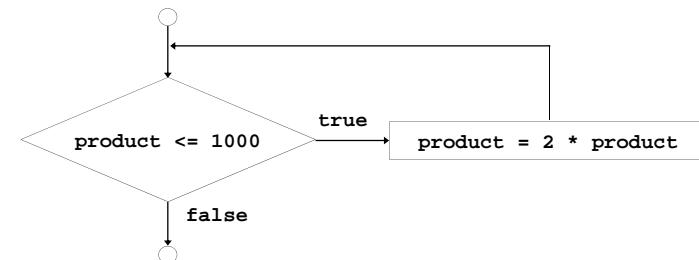

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

whi l e Repetition Statement

- Esempio:

```
int product = 2;
while ( product <= 1000 )
    product = 2 * product;
```

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Ripetizione Counter-Controlled

- Ripetizione Counter-controlled

- Ciclo ripetuto fino a quando un contatore raggiunge un certo valore
- Il numero di ripetizioni è noto a priori
- Esempio: 10 studenti rispondono ad un quiz. I risultati (interi tra 0 e 100) per questo quiz sono disponibili. Determinare la media della classe per quel quiz
- Pseudocodice:

Set total to zero

Set grade counter to one

While grade counter is less than or equal to ten

Input the next grade

Add the grade into the total

Add one to the grade counter

Set the class average to the total divided by ten

Print the class average

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

```

25 /* termination phase */
26 average = total / 10;      /* Integer division */
27
28 /* display result */
29 printf( "Class average is %d\n", average );
30
31 return 0; /* Indicate program ended successfully */
32
33 } /* end function main */
Enter grade: 98
Enter grade: 76
Enter grade: 71
Enter grade: 87
Enter grade: 83
Enter grade: 90
Enter grade: 57
Enter grade: 79
Enter grade: 82
Enter grade: 94
Class average is 81

```

Outline

fig03_06.c (Part 2 of 2)

Program Output

```

1 /* Fig. 3.6: fig03_06.c
2 Class average program with counter-controlled repetition */
3 #include <stdio.h>
4
5 /* Function main begins program execution */
6 int main()
7 {
8     int counter; /* number of grade to be entered next */
9     int grade;   /* grade value */
10    int total;  /* sum of grades input by user */
11    int average; /* average of grades */
12
13    /* Initialization phase */
14    total = 0;    /* Initialize total */
15    counter = 1; /* Initialize loop counter */
16
17    /* processing phase */
18    while ( counter <= 10 ) { /* Loop 10 times */
19        printf( "Enter grade: " ); /* prompt for input */
20        scanf( "%d", &grade ); /* read grade from user */
21        total = total + grade; /* add grade to total */
22        counter = counter + 1; /* increment counter */
23    } /* end while */
24

```

[Outline](#)
fig03_06.c (Part 1 of 2)

Uso di una sentinella

- Il problema diviene:

Sviluppare un programma per calcolare la media della classe su un numero qualsiasi di studenti.

- Numero di studenti non conosciuto a priori
- Come fa il programma a sapere quando deve terminare?

- Usare un valore *sentinella*

- Indica “la fine dell’inserimento dei dati”
- Il ciclo termina quando l’utente inserisce il valore sentinella
- Il valore sentinella viene scelto in modo che non possa essere confuso con un input regolare (ad esempio -1 in questo esempio)

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Uso di una sentinella

Initialize total to zero

Initialize counter to zero

Input the first grade

While the user has not as yet entered the sentinel

Add this grade into the running total

Add one to the grade counter

Input the next grade (possibly the sentinel)

If the counter is not equal to zero

Set the average to the total divided by the counter

Print the average

else

Print "No grades were entered"

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Outline

Program Output

```

Enter grade, -1 to end: 75
Enter grade, -1 to end: 94
Enter grade, -1 to end: 97
Enter grade, -1 to end: 88
Enter grade, -1 to end: 70
Enter grade, -1 to end: 64
Enter grade, -1 to end: 83
Enter grade, -1 to end: 89
Enter grade, -1 to end: -1
Class average is 82.50

```

```

Enter grade, -1 to end: -1
No grades were entered

```

Strutture di controllo innestate

- Problema
 - Un college ha una lista di risultati di test (1 = superato, 2 = fallito) per 10 studenti
 - Scrivere un programma che analizzi i risultati
 - Se più di 8 studenti superano il test, allora stampa "Insegnamento OK"
- Nota
 - Il programma deve processare 10 risultati del test
 - Sarà usato un ciclo counter-controlled
 - Possono essere usati due contatori
 - Uno per il numero di "superato", uno per il numero di "fallito"
 - Ogni risultato del test result è un numero —1 oppure 2
 - Se il numero non è 1, assumiamo sia 2

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Strutture di controllo innestate

- Refine *Input the ten quiz grades and count passes and failures to*

While student counter is less than or equal to ten
Input the next exam result
If the student passed
Add one to passes
else
Add one to failures
Add one to student counter

- Refine *Print a summary of the exam results and decide if tuition should be raised to*

Print the number of passes
Print the number of failures
If more than eight students passed
Print "Raise tuition"

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Strutture di controllo innestate

- Top level outline

Analyze exam results and decide if tuition should be raised

- First Refinement

Initialize variables

Input the ten quiz grades and count passes and failures

Print a summary of the exam results and decide if tuition should be raised

- Refine *Initialize variables* to

Initialize passes to zero

Initialize failures to zero

Initialize student counter to one

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Strutture di controllo innestate

Initialize passes to zero
Initialize failures to zero
Initialize student to one

While student counter is less than or equal to ten
Input the next exam result

If the student passed
Add one to passes
else
Add one to failures

Add one to student counter

Print the number of passes
Print the number of failures
If more than eight students passed
Print "Raise tuition"

Operatori di assegnamento

- Gli operatori di assegnamento abbreviano le espressioni di assegnamento

$C = C + 3;$

può essere abbreviato in $C += 3$

- Statement nella forma

variable = variable operator expression;

possono essere riscritti nella forma

variable operator= expression;

- Esempi di altri operatori di assegnamento:

$d -= 4$ ($d = d - 4$)

$e *= 5$ ($e = e * 5$)

$f /= 3$ ($f = f / 3$)

$g %= 9$ ($g = g \% 9$)

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

28

Operatori di assegnamento

Siano: `int c = 3, d = 5, e = 4, f = 6, g = 12;`

Operatore di assegnamento	Esempio di espressione	Spiegazione	Assegna
<code>+=</code>	<code>c += 7</code>	<code>c = c + 7</code>	10 a c
<code>-=</code>	<code>d -= 4</code>	<code>d = d - 4</code>	1 a d
<code>*=</code>	<code>e *= 5</code>	<code>e = e * 5</code>	20 a e
<code>/=</code>	<code>f /= 3</code>	<code>f = f / 3</code>	2 a f
<code>%=</code>	<code>g %= 9</code>	<code>g = g % 9</code>	3 a g

Fig. 3.11 Operatori aritmetici di assegnamento.

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Operatori di Incremento e Decremento

- Se `c` è uguale a 5, allora

```
printf( "%d", ++c );
```

 – Stampa 6

```
printf( "%d", c++ );
```

 – Stampa 5
 – In entrambi i casi, `c` ha il valore 6
- Quando la variabile non è in un'espressione
 - Preincremento e postincremento hanno lo stesso effetto

```
++c;
```

```
printf( "%d", c );
```
 - Ha lo stesso effetto di

```
C++;
```

```
printf( "%d", c );
```

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Operatori di Incremento e Decremento

- Operatore di Incremento (`++`)
 - Può essere usato invece di `c+=1`
- Operatore di Decremento (`--`)
 - Può essere usato invece di `c-=1`
- Preincremento
 - L'operatore è usato prima della variabile (`++c` or `--c`)
 - La variabile è cambiata prima che l'espressione che la contiene sia valutata
- Postincremento
 - L'operatore è usato dopo la variabile (`c++` or `c--`)
 - L'espressione viene eseguita prima che la variabile sia cambiata

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.
