

Capitolo 5 - Funzioni

Outline

Introduzione
Moduli in C
Math Library Functions
Funzioni
Definizione di Funzioni
Prototipi di Funzione
Header Files
Chiamata di funzioni per valore e referenza
Random Number Generation
Storage Classes
Scope Rules
Ricorsione
La serie di Fibonacci
Ricorsione vs. Iterazione

Introduzione

- Divide and conquer
 - Costruire un programma da pezzi più piccoli o da singole componenti
 - Questi pezzi più piccoli sono chiamati moduli
 - Ogni singolo pezzo è più facilmente gestibile rispetto al programma principale

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Moduli in C

- Functions
 - Moduli in C
 - Il programma combina funzioni user-defined con funzioni di libreria
 - La libreria standard del C ha una grande varietà di funzioni
- Chiamata di funzioni
 - Invocazione
 - Si fornisce il nome della funzione e gli argomenti (dati)
 - La funzione esegue le operazioni opportune
 - La funzione restituisce un risultato

Math Library Functions

- Math library functions
 - Eseguono comuni calcoli matematici
 - `#include <math.h>`
- Formato per la chiamata di funzioni
 - `functionName(argument);`
 - Se ci sono più argomenti, si usa una lista separata da virgole
 - `printf("%.2f", sqrt(900.0));`
 - Chiama la funzione `sqrt`, che restituisce la radice quadrata dell'argomento
 - Tutte le funzioni matematiche restituiscono dati di tipo `double`
 - Gli argomenti possono essere costanti, variabili o espressioni

Math Library Functions

Function	Description	Example
<code>sqrt(x)</code>	square root of x	<code>sqrt(900.0)</code> is 30.0 <code>sqrt(9.0)</code> is 3.0
<code>exp(x)</code>	exponential function e^x	<code>exp(1.0)</code> is 2.718282 <code>exp(2.0)</code> is 7.389056
<code>log(x)</code>	natural logarithm of x (base e)	<code>log(2.718282)</code> is 1.0 <code>log(7.389056)</code> is 2.0
<code>log10(x)</code>	logarithm of x (base 10)	<code>log10(1.0)</code> is 0.0 <code>log10(10.0)</code> is 1.0 <code>log10(100.0)</code> is 2.0
<code>fabs(x)</code>	absolute value of x	<code>fabs(5.0)</code> is 5.0 <code>fabs(0.0)</code> is 0.0 <code>fabs(-5.0)</code> is 5.0
<code>ceil(x)</code>	rounds x to the smallest integer not less than x	<code>ceil(9.2)</code> is 10.0 <code>ceil(-9.8)</code> is -9.0
<code>floor(x)</code>	rounds x to the largest integer not greater than x	<code>floor(9.2)</code> is 9.0 <code>floor(-9.8)</code> is -10.0
<code>pow(x, y)</code>	x raised to power y (x^y)	<code>pow(2, 7)</code> is 128.0 <code>pow(9, 5)</code> is 3.0
<code>fmod(x, y)</code>	remainder of x/y as a floating point number	<code>fmod(13.657, 2.333)</code> is 1.992
<code>sin(x)</code>	trigonometric sine of x (x in radians)	<code>sin(0.0)</code> is 0.0
<code>cos(x)</code>	trigonometric cosine of x (x in radians)	<code>cos(0.0)</code> is 1.0
<code>tan(x)</code>	trigonometric tangent of x (x in radians)	<code>tan(0.0)</code> is 0.0

Fig. 5.2 Commonly used math library functions.

Funzioni

• Funzioni

- Modularizzano un programma
- Tutte le variabili definite all'interno delle funzioni sono locali
 - Conosciute solo nella funzione in cui sono state definite
- Parametri
 - Permettono la comunicazione tra funzioni
 - Sono anch'essi variabili locali

• Benefici delle funzioni

- Divide and conquer
- Software reusability
 - Uso di funzioni esistenti come building blocks per nuovi programmi
 - Astrazione – nascondono i dettagli interni
- Evitano la ripetizione del codice

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Definizione di funzioni

• Formato per la definizione di funzioni

```
return-value-type function-name( parameter-list )
{
    declarations and statements
}
```

- Function-name: ogni identificatore valido
- Return-value-type: tipo del risultato (default `int`)
 - `void` – indica che la funzione non restituisce nulla
- Parameter-list: lista separata da virgole che permette di dichiarare i parametri
 - Specificare il tipo per ogni parametro

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Definizione di funzioni

• Formato per la definizione di funzioni (continua)

```
return-value-type function-name( parameter-list )
{
    declarations and statements
}
```

- Declarations and statements: corpo della funzione (block)
 - Le variabili possono essere definite all'interno del blocco (possono essere innestati)
 - Le funzioni non possono essere definite all'interno di altre funzioni (**non è permesso l'annidamento**)
- Ritorno del controllo
 - Se non deve essere restituito nulla all'esterno
 - `return;`
 - oppure si raggiunge la parentesi di chiusura
 - Se qualcosa deve essere restituito
 - `return expression;`

fig05_04.c (Part 2 of 2)

Program Output

Prototipi di funzione

- Prototipi di funzione
 - Tipo di ritorno (default int)
 - Nome della funzione
 - Parametri di input
 - Usati per validare le funzioni
 - I prototipi sono necessari solo quando la definizione delle funzioni avviene dopo l'uso nel programma
 - La funzione con il seguente prototipo

```
int maximum( int x, int y, int z );
```

 - Ha tre parametri di input interi
 - Restituisce un int

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Header Files

- Header files
 - Contengono i prototipi delle funzioni per le funzioni di libreria
 - `<stdlib.h>`, `<math.h>`, etc...
 - Caricati con `#include <filename>`
`#include <math.h>`
- Custom header files
 - Creare file con delle funzioni
 - Salvare il file come `filename.h`
 - Caricarlo in altri file con `#include "filename.h"`
 - Riutilizzo di funzioni

Header Files

Standard library header	Explanation
<code><assert.h></code>	Contains macros and information for adding diagnostics that aid program debugging.
<code><ctype.h></code>	Contains function prototypes for functions that test characters for certain properties, and function prototypes for functions that can be used to convert lowercase letters to uppercase letters and vice versa.
<code><errno.h></code>	Defines macros that are useful for reporting error conditions.
<code><float.h></code>	Contains the floating point size limits of the system.
<code><limits.h></code>	Contains the integral size limits of the system.
<code><locale.h></code>	Contains function prototypes and other information that enables a program to be modified for the current locale on which it is running. The notion of locale enables the computer system to handle different conventions for expressing data like dates, times, dollar amounts and large numbers throughout the world.
<code><math.h></code>	Contains function prototypes for math library functions.
<code><setjmp.h></code>	Contains function prototypes for functions that allow bypassing of the usual function call and return sequence.
<code><signal.h></code>	Contains function prototypes and macros to handle various conditions that may arise during program execution.
<code><stdarg.h></code>	Defines macros for dealing with a list of arguments to a function whose number and types are unknown.
<code><stddef.h></code>	Contains common definitions of types used by C for performing certain calculations.
<code><stdio.h></code>	Contains function prototypes for the standard input/output library functions, and information used by them.
<code><stdlib.h></code>	Contains function prototypes for conversions of numbers to text and text to numbers, memory allocation, random numbers, and other utility functions.
<code><string.h></code>	Contains function prototypes for string processing functions.
<code><time.h></code>	Contains function prototypes and types for manipulating the time and date.

Fig. 5.6 Some of the standard library header.

Chiamata di funzioni per valore e riferimento

- Chiamata per valore
 - Copia un argomento passato ad una funzione
 - I cambiamenti nella funzione non hanno effetto sui parametri originali
 - Usare quando la funzione non ha bisogno di modificare degli argomenti
 - Evita modifiche accidentali
- Chiamata per riferimento (o indirizzo)
 - Passa l'indirizzo di memoria in cui si trovano gli argomenti originali
 - I cambiamenti nella funzione hanno effetto sui parametri originali
- Per ora focalizziamoci solo sulle chiamate per valore

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Random Number Generation

- rand function
 - `<stdlib.h>`
 - Restituisce un numero "random" tra 0 and RAND_MAX (al massimo 32767)
`i = rand();`
 - Pseudorandom
 - Sequence predefinita di numeri "random"
 - Stessa sequenza per ogni chiamata della funzione
- Scaling
 - Per avere un numero random tra 1 and n
`1 + (rand() % n)`
 - `rand() % n` restituisce un numero tra 0 e $n - 1$
 - Aggiungere 1 per rendere il numero tra 1 ed n
`1 + (rand() % 6)`
 - numeri tra 1 e 6

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Random Number Generation

- srand function
 - `<stdlib.h>`
 - Takes an integer seed and jumps to that location in its "random" sequence
`srand(seed);`
 - `srand(time(NULL));` /*load `<time.h>` */
 - `time(NULL)`
 - Returns the time at which the program was compiled in seconds
 - "Randomizes" the seed

Program Output

Example: A Game of Chance

- Craps simulator
- Rules
 - Roll two dice
 - 7 or 11 on first throw, player wins
 - 2, 3, or 12 on first throw, player loses
 - 4, 5, 6, 8, 9, 10 - value becomes player's "point"
 - Player must roll his point before rolling 7 to win

```

Storage Classes

- Storage class specifiers
 - Specificano la durata di un oggetto in memoria
- Automatic storage
 - Gli oggetti sono creati e distrutti all'interno del loro blocco
 - auto: default for variabili locali
 - auto double x, y;
 - register: tenta di inserire la variabile in registri ad alta velocità
 - register int counter = 1;

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Storage Classes

- Static storage
 - Le variabili esistono per l'intera esecuzione del programma
 - Il valore di default è zero
 - `static`: variabili locali definite nelle funzioni.
 - Mantengono il valore dopo il termine della funzione
 - Conosciute solo nella propria funzione
 - `extern`: default per variabili globali e funzioni
 - Conosciute in ogni funzione

Scope Rules

- File scope
 - Gli identificatori definiti fuori dalla funzione sono conosciuti in tutte le funzioni
 - Usato per le variabili globali, la definizione di funzioni, e i prototipi di funzione
- Function scope
 - Possono essere referenziati solo all'interno del corpo di una funzione

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Scope Rules

- Block scope
 - Identificatori dichiarati all'interno di un blocco
 - La visibilità nel blocco comincia dalla definizione e termina con la parentesi destra di chiusura del blocco
 - Usato per variabili, parametri di funzioni
 - Blocchi esterni "nascosti" dai blocchi interni se esiste una variabile con lo stesso nome nel blocco interno
- Function prototype scope
 - Usato per gli identificatori nella lista dei parametri

Program Output

Ricorsione

- Funzioni ricorsive
 - Funzioni che richiamano se stesse
 - Necessità di un livello assiomatico
 - La funzione lancia una copia di se stessa (passo ricorsivo) per risolvere il problema

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

© Copyright 1992–2004 by Deitel & Associates, Inc. and Pearson Education Inc. All Rights Reserved.

Ricorsione

• Esempio: fattoriale

- $5! = 5 * 4 * 3 * 2 * 1$
- Nota che
 - $5! = 5 * 4!$
 - $4! = 4 * 3! \dots$
- Possibile computazione ricorsiva
- Livello assiomatico (caso base) ($1! = 0! = 1$)
 - $2! = 2 * 1! = 2 * 1 = 2;$
 - $3! = 3 * 2! = 3 * 2 = 6;$

La serie di Fibonacci

- Serie di Fibonacci: 0, 1, 1, 2, 3, 5, 8...
 - Ogni numero è la somma dei due precedenti
 - Definizione ricorsiva:
 - $fib(n) = fib(n - 1) + fib(n - 2)$
 - Codice per la funzione di fibonacci

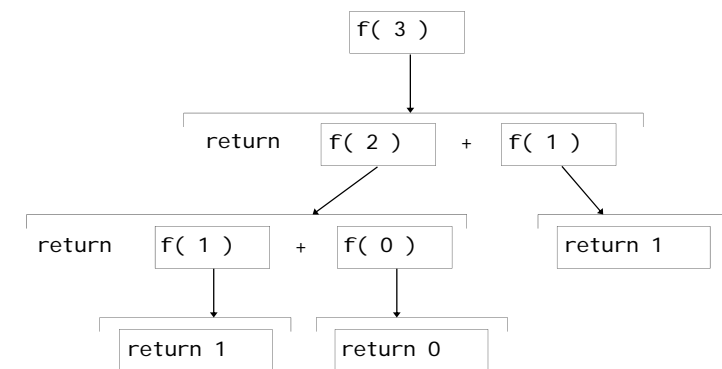

```
long fibonacci ( long n )
{
    if ( n == 0 || n == 1 ) // base case
        return n;
    else
        return fibonacci ( n - 1 ) +
            fibonacci ( n - 2 );
}
```

Program Output
(continued)

Ricorsione vs. Iterazione

- Ripetizione
 - Iterazione: loop esplicito
 - Ricorsione: chiamate ripetute di funzione
- Terminazione
 - Iterazione: fallisce la condizione del loop
 - Ricorsione: passo base (livello assiomatico) riconosciuto
- Possibilità di loop infiniti per entrambe
- Balance
 - Scelta tra performance (iterazione) e buon software engineering (ricorsione)
