

Capitolo 10 - Strutture, Unioni, Manipolazione di Bit, ed Enumerazioni

1

Outline

- 10.1 Introduzione
- 10.2 Definizione di Strutture
- 10.3 Inizializzazione di strutture
- 10.4 Accesso alle componenti di una struttura
- 10.5 Utilizzo delle strutture con le funzioni
- 10.6 typedef
- 10.7 Esempio
- 10.8 Union
- 10.9 Operatori Bitwise
- 10.10 Campi di Bit
- 10.11 Enumerazioni

Obiettivi

- In questo capitolo, impareremo a:
 - Creare e utilizzare le strutture, le union e le enumerazioni.
 - Passare strutture a funzioni: *call by value* e *call by reference*.
 - Manipolare i dati con gli operatori bitwise.
 - Creare i campi di bit per la memorizzazione compatta dei dati.

2

10.1 Introduzione

3

- Strutture
 - Collezioni di variabili correlate (aggregati) sotto un nome
 - Può contenere variabili di tipo diverso
 - Utilizzate di solito per definire record da memorizzare nei file
 - Combinate con i puntatori, possono essere utilizzate per la creazione di liste collegate, pile, code ed alberi

10.2 Definizione di strutture

4

- Esempio

```
struct card {
    char *face;
    char *suit;
};
```

 - `struct` introduce la definizione della struttura `card`
 - `card` è il nome della struttura ed è utilizzato per dichiarare variabili di questo tipo di struttura
 - `card` contiene due componenti di tipo `char *`
 - Queste componenti sono `face` e `suit`

10.2 Definizione di strutture

- **struct**
 - Una `struct` non può contenere un'istanza di se stessa
 - Non può contenere una componente che è un puntatore allo stesso tipo di struttura
 - Una definizione di struttura non alloca spazio in memoria
 - Crea invece un nuovo tipo di dato (astrazione dati)
- **Definizioni**
 - Definita come le altre variabili:

```
card oneCard, deck[ 52 ], *cPtr;
```
 - Si può utilizzare una lista separata da virgole:

```
struct card {
    char *face;
    char *suit;
} oneCard, deck[ 52 ], *cPtr;
```

10.2 Definizione di strutture

Fig. 10.1) A possible storage alignment for a variable of type `struct example` showing an undefined area in memory.

10.2 Definizione di strutture

- **Operazioni valide**
 - Assegnare una struttura ad una struttura dello stesso tipo
 - Ottenere l'indirizzo (&) di una struttura
 - Accedere alle componenti di una struttura
 - Utilizzare l'operatore `sizeof` per determinare la dimensione della struttura

10.3 Inizializzazione di strutture

- **Liste di inizializzazione**
 - Esempio:

```
card oneCard = { "Three", "Hearts" };
```
- **Assegnamento**
 - Esempio:

```
card threeHearts = oneCard;
```
 - Si potrebbe definire ed inizializzare `threeHearts` come segue:

```
card threeHearts;
threeHearts.face = "Three";
threeHearts.suit = "Hearts";
```

10.4 Accedere alle componenti

- Accedere alle componenti di una struttura
 - L'operatore punto (.) utilizzato con la variabile struttura

```
card myCard;
printf( "%s", myCard.suit );
```
 - L'operatore freccia (->) utilizzato per puntatori a strutture

```
card *myCardPtr = &myCard;
printf( "%s", myCardPtr->suit );
```
 - `myCardPtr->suit` è equivalente a

```
( *myCardPtr ).suit
```

```

1  /* Fig. 10.2: fig10_02.c
2  Using the structure member and
3  structure pointer operators */
4  #include <stdio.h>
5
6  /* card structure definition */
7  struct card {
8      char *face; /* define pointer face */
9      char *suit; /* define pointer suit */
10 }; /* end structure card */
11
12 int main()
13 {
14     struct card a; /* define struct a */
15     struct card *aPtr; /* define a pointer to card */
16
17     /* place strings into card structures */
18     a.face = "Ace";
19     a.suit = "Spades";
20
21     aPtr = &a; /* assign address of a to aPtr */
22

```

Outline

fig10_02.c (Part 1 of 2)

```

23     printf( "%s%s\n%s%s\n%s%s\n", a.face, " of ", a.suit,
24           aPtr->face, " of ", aPtr->suit,
25           ( *aPtr ).face, " of ", ( *aPtr ).suit );
26
27     return 0; /* indicates successful termination */
28
29 } /* end main */

```

Outline

```

Ace of Spades
Ace of Spades
Ace of Spades

```

Program Output

10.5 Utilizzare le strutture con le funzioni

- Passaggio di strutture a funzioni
 - Passare l'intera struttura
 - O, passare le singole componenti
 - Passaggio call by value
- Passare strutture call-by-reference
 - Passare il suo indirizzo
 - Passare il suo riferimento
- Passare array call-by-value
 - Creare una struttura con array come componente
 - Passare la struttura

10.6 typedef

- typedef
 - Crea dei sinonimi (alias) per tipi di dati definiti precedentemente
 - Utilizzare la typedef per creare tipi di nomi più corti
 - Esempio:

```
typedef struct Card *CardPtr;
```
 - Definisce un nuovo nome di tipo di dato CardPtr come sinonimo per il tipo struct Card *
 - typedef non crea un nuovo tipo di dato
 - Crea solo un alias

10.7 Esempio

- Pseudo codice:
 - Creare un array di strutture card
 - Mettere le carte nel mazzo
 - Mescolare il mazzo
 - Distribuire le carte

```

1  /* Fig. 10.3: fig10_03.c
2  The card shuffling and dealing program using structures */
3  #include <stdio.h>
4  #include <stdlib.h>
5  #include <time.h>

 **Program Output**

10.8 Union

- union
 - Spazio di memoria che può contenere vari oggetti nel tempo
 - Contiene solo un dato alla volta
 - Le componenti di una union condividono spazio
 - Risparmia la memoria
 - Solo l'ultima componente definita è accessibile
- union definizioni
 - Come la struct

```

union Number {
    int x;
    float y;
};
union Number value;

```

20

10.8 Union

• Operazioni uni on valide

- Assegnamento alla uni on dello stesso tipo: =
- Ottenere l'indirizzo: &
- Far riferimento alle componenti di una union: .
- Far riferimento alle componenti utilizzando i puntatori: ->

Outline

Put a value in the floating member
and print both members.
Int:  0
double:
100.000000
```

10.9 Operatori Bitwise

- Tutti i dati sono rappresentati come sequenze di bit
 - Ogni bit può essere 0 o 1
 - Sequenze di 8 bit costituiscono un byte

Operator		Description
&	bitwise AND	The bits in the result are set to 1 if the corresponding bits in the two operands are both 1.
	bitwise inclusive OR	The bits in the result are set to 1 if at least one of the corresponding bits in the two operands is 1.
^	bitwise exclusive OR	The bits in the result are set to 1 if exactly one of the corresponding bits in the two operands is 1.
<<	left shift	Shifts the bits of the first operand left by the number of bits specified by the second operand; fill from the right with 0 bits.
>>	right shift	Shifts the bits of the first operand right by the number of bits specified by the second operand; the method of filling from the left is machine dependent.
~	one's complement	All 0 bits are set to 1 and all 1 bits are set to 0.

Fig. 10.6

=	Bitwise inclusive OR assignment operator.
^=	Bitwise exclusive OR assignment operator.
<<=	Left-shift assignment operator.
>>=	Right-shift assignment operator.

Fig. 10.14 The bitwise assignment operators.

10.9 Operatori Bitwise

Operator	Associativity	Type
() [] . ->	left to right	Highest
+ - ++ -- ! & * ~ sizeof (type)	right to left	Unary
* / %	left to right	multiplicative
+ -	left to right	additive
<< >>	left to right	shifting
< <= > >=	left to right	relational
== !=	left to right	equality
&	left to right	bitwise AND
^	left to right	bitwise OR
	left to right	bitwise OR
&&	left to right	logical AND
	left to right	logical OR
?:	right to left	conditional
= += -= *= /= &= = ^= <<= >>= %=	right to left	assignment
,	left to right	comma

Fig. 10.15 Operator precedence and associativity.

10.10 Campi di Bit

- Campi di bit
 - Le componenti di una struttura le cui dimensioni (in bit) sono state specificate
 - Permette un miglior utilizzo della memoria
 - Devono essere definiti come `int` o `unsigned`
 - Non è possibile accedere ai singoli bit
- Definire i campi di bit
 - Segue una componente `unsigned` o `int` con un due punti (:) ed una costante intera che rappresenta la dimensione del campo
 - Esempio:

```
struct BitCard {
    unsigned face : 4;
    unsigned suit : 2;
    unsigned color : 1;
};
```

10.10 Campi di Bit

- Campi di bit senza nome
 - Campi utilizzati come padding in una struttura
 - Niente si può memorizzare nei bit

```
struct Example {
    unsigned a : 13;
    unsigned : 3;
    unsigned b : 4;
}
```
 - I campi di bit senza nome con dimensione zero allineano il successivo campo di bit ad una nuova unità di memorizzazione

```

1  /* Fig. 10.16: fig10_16.c
2  Representing cards with bit fields in a struct */
3
4  #include <stdio.h>
5
6  /* bitCard structure definition with bit fields */
7  struct bitCard {
8      unsigned face : 4; /* 4 bits; 0-15 */
9      unsigned suit : 2; /* 2 bits; 0-3 */
10     unsigned color : 1; /* 1 bit; 0-1 */
11 }; /* end struct bitCard */
12
13 typedef struct bitCard Card;
14
15 void fillDeck( Card * const wDeck ); /* prototype */
16 void deal( const Card * const wDeck ); /* prototype */
17
18 int main()
19 {
20     Card deck[ 52 ]; /* create array of Cards */
21
22     fillDeck( deck );
23     deal( deck );
24
25     return 0; /* Indicates successful termination */
26

Program Output

10.11 Le costanti di enumerazione

• Enumerazioni

- Insieme di costanti intere rappresentate da identificatori
- Le costanti di enumerazione sono come le costanti simboliche i cui valori vengono settati automaticamente
 - I valori partono da 0 e sono incrementati di 1
 - I valori possono essere assegnati esplicitamente con =
 - Necessitano di nomi unici
- Esempio:

```
enum Months { JAN = 1, FEB, MAR, APR, MAY, JUN, JUL,
              AUG, SEP, OCT, NOV, DEC};
```

 - Crea un nuovo tipo enum Months in cui gli identificatori sono settati agli interi da 1 a 12
- Le variabili enumerazione possono assumere solo i valori della loro enumerazione

```

1  /* Fig. 10.18: fig10_18.c
2  Using an enumeration type */
3  #include <stdio.h>
4
5  /* enumeration constants represent months of the year */
6  enum months { JAN = 1, FEB, MAR, APR, MAY, JUN,
7              JUL, AUG, SEP, OCT, NOV, DEC };
8
9  int main()
10 {
11     enum months month; /* can contain any of the 12 months */
12
13     /* Initialize array of pointers */
14     const char *monthName[] = { "", "January", "February", "March",
15                                "April", "May", "June", "July", "August", "September", "October",
16                                "November", "December" };
17
18     /* loop through months */
19     for ( month = JAN; month <= DEC; month++ ) {
20         printf( "%2d%11s\n", month, monthName[ month ] );
21     } /* end for */
22
23     return 0; /* indicates successful termination */
24 } /* end main */
